

LOVE YOUR BUDGET

And stick to it!

DEN 27 DECEMBER 2022

LARS JENSEN

When hard times are upon us it is very important to keep track of your income and your expenses. With *Love your budget*™ you will get a tool to do just that! Add your income, register your expenses, and keep track of your finances over time.

Love your budget™ will use SQL Server to persist data and will also have a report function to plot your income and expenses over time. It also has a tool for registering information about loans, mortgages, and reports tools for that.

MVP, minimum viable product, is to be able to register income and expenses with a fixed set of categories. The user should be able to get a report, a diagram, with the income and expenses presented. The user should also be able to register information about loans and to be able to calculate – using threads – the effects of raised interest rates and change of mortgage which also should be presented to the user in a diagram. The design pattern used will be MVVM.

Bonus goals

- Be able to add your own cost categories
